

RMOTC ANNUAL REPORT

RED, Inc. produced the RMOTC annual report. This report related RMOTC successes to a high level audience including industry, academia, and congress. The annual report was part of marketing campaign aimed at bringing awareness to RMOTC programs and partnerships. RED, Inc. was responsible for writing the annual report, photography, and layout.

TESTING AND DEMONSTRATION **EXPLORATION**

FINDING SOLUTIONS to today's energy development issues has been the focal point of the Rocky Mountain Oilfield Testing Center (RMOTC) throughout 2003 and 2004; this will continue in FY 2005. The United States is a mature oil-producing region experiencing a decline in its domestic oil production for the past 30 years, making domestic production more difficult and expensive than overseas production.

For every barrel of crude oil produced in this country,

Much of our oil and gas can be recovered, and at RMOTC we believe that through testing, demonstration and development of advanced technology, it will be recovered. Energy fuels the economy. By understanding this, RMOTC's testing and demonstration operation experts are partnering with industry, state and federal agencies, national laboratories, academia and international consortia, all of whom are concentrating their efforts on:

- Decreasing dependency on foreign oil
- Increasing domestic production
- Improving technology to explore for complex reservoirs

ENERGY ASSURANCE FOCUS

OUR PERSPECTIVE on the world has shifted—from one in which the threat of domestic terrorism seemed distant—to one in which threats of additional terrorist attacks on the United States are a startling reality. In this new and uncertain environment, the United States must renew its focus on prevention, preparedness, response, restoration, and crisis mitigation—a foundation of defense put in place to serve as a building block for our nation's homeland security program.

IS | 2003/2004

ence in make America's pipelines safer. Extensive field tests of advanced technologies for remote sensing of natural gas leaks were successfully performed in 2004. Development and access to this technology will enable the gas industry to rapidly and accurately monitor large sections of the nation's natural gas pipelines and distribution systems for leaks, protect the American economy by helping pipeline companies ensure steady flows of natural gas, enhance the reliability of the infrastructure, and increase our nation's safety. The complexity and interconnectedness of homeland security issues require a broad perspective, a perspective

OUTREACH. RMOTC feels that knowledge is a key variable in environmental and energy literacy. In order to learn skills necessary for engaging in problem resolution, students should be able to recognize environmental problems and analyze the role of humans in creating and perpetuating such problems. Similarly, future generations need to have a balanced understanding of energy supply and demand issues in order to make wise choices for energy development

It is my experience that RMOTC is a very proactive and innovative organization... committed to bringing new technology and teamwork to task of solving problems at the field level.

Nuevo Energy

and alternative energy sources. With this in mind, RMOTC sponsors a variety of community and educational outreach activities in order to share our environmental expertise and spread awareness of today's environment concerns. Furthermore, we seek to promote science education in general to have informed citizens in our communities.
